

Extend the grazing season in your pastures with RyzUp SmartGrass.

Fall and spring are crucial periods for balancing pasture growth and providing quality feed for grazing animals. RyzUp SmartGrass, a naturally occurring plant growth regulator, applied to grass-based pastures during late fall and early spring months will stimulate pasture growth and increase dry matter per acre with no loss of feed quality.

Applied when temperatures are between 40 and 60 degrees Fahrenheit, RyzUp SmartGrass provides accelerated grass growth for up to 3 to 4 weeks, provided adequate soil moisture and nutrition is available. It also decreases the resting time required for paddocks to reach optimal grazing height, allowing for more frequent paddock rotations and better land utilization.

RyzUp SmartGrass is listed by the Organic Materials Review Institute (OMRI) for use in organic production. For more information on OMRI-listed products, visit www.omri.org.

RyzUp SmartGrass is listed by the National Organic Program (NOP) for use in organic production. For more information on NOP-listed products, visit www.usda.gov.
